Updated:	04/13/2015	Due date:	

Subject:	Install problems first system cl-update, eudev udev issues
Description:	Fresh installation first system update here is my error
	630 packages will be installed, 1346213 KiB will be downloaded
	not be installed simultaneously. You may want to try a larger value of
	the --backtrack option, such as --backtrack=30, in order to see if
	that will solve this conflict automatically.
	For more information, see MASKED PACKAGES section in the emerge man
	page or refer to the Gentoo Handbook.
	Error: The above package list contains packages which cannot be
	installed at the same time on the same system.
	(sys-fs/eudev-3.0:0/0::gentoo, binary scheduled for merge) pulled in by
	=sys-fs/eudev-1.5.3-r1:0/0[abi_x86_32(),abi_x86_64(),gudev] required by
	(virtual/libgudev-215-r1:0/0::gentoo, binary scheduled for merge)
	(sys-fs/udev-216:0/0::gentoo, ebuild scheduled for merge) pulled in by
	=sys-fs/udev-208-r1:0/0[abi_x86_32(),abi_x86_64()] required by (virtual/libudev-215-r1:0/1::gentoo, binary
	scheduled for merge)
	=sys-fs/udev-208-r1 required by (virtual/udev-215:0/0::gentoo, installed)
	For more information about Blocked Packages, please refer to the following
	section of the Gentoo Linux x86 Handbook (architecture is irrelevant):
	http://www.gentoo.org/doc/en/handbook/handbook-x86.xml?full=1#blocked
	!!! The following installed packages are masked:
	- dev-lang/perl-5.18.2-r2::gentoo (masked by: package.mask)
	/usr/portage/profiles/package.mask:
	Andreas K. Huettel <dilfridge@gentoo.org> (29 Mar 2015)
	Mask Perl 5.18 for removal. Please upgrade to Perl 5.20
	For more information, see the MASKED PACKAGES section in the emerge
	man page or refer to the Gentoo Handbook.
	Any help would be appreciated I am new to Calculate and Gentoo Thanks

What is build of your system

<pre>

cl-core-variables-show --only-value main.os_linux_build

</pre>

Did you install any packages?

04/08/2015 11:48 am - john robertson

here is the build# 20141230

No I have not installed anything yet. I did a Fresh re-install of 14.12.1 KDE x86-84 after reboot did the first update with Calculate Linux Update and got the error above also I did cl-update through the terminal and got the same result.

Thank You

I downloaded a new image from the STAGES section of downloads the newest one under weekly images and it installed and updated just fine. Instead of 630 updates I only needed 6 then another 10 after calculating dependencies. Looks like older build versions of the release may not update well. My

new image build # is 20150410 the one I was having trouble with looks to be quite old. So in the future anyone having problems updating their system after a fresh installation try downloading the latest weekly image under STAGES.

We fix update from 14.12.1. Normally update goes without collision, but problems sometimes occur.We try to fix them, but it sometimes takes a long time. The problem that you describe, has occured because of a major upgrade utilities. If you have not install any packages and use system "from box" perhaps maybe easier and faster to reinstall the system. Especially if you have double root partitioning.
