| Subject: | [MacBookPro] Cannot shutdown Calculate Linux | | |
| Description: | <p>Cannot shutdown Calculate-Linux on my MacBookPro.</p> <p>After a bit of investigation it become clear that root cause is the bug is in Linux kernel https://bugzilla.kernel.org/show_bug.cgi?id=103211</p> <p>By this link patches are also available.</p> <p>Ubuntu already adopted this patch, but Calculate - doesn't ---</p> <p>So please adopt patch also, the issue is really annoying.</p> <p>One day I hope just to do 'cl-update' and see that issue disappeared.</p> <p>Thanks in advance.</p> | | |
